

# Server-based scheduling in CAN

## Subsystem integration of real-time systems

MÄLARDALEN REAL-TIME  
RESEARCH CENTRE

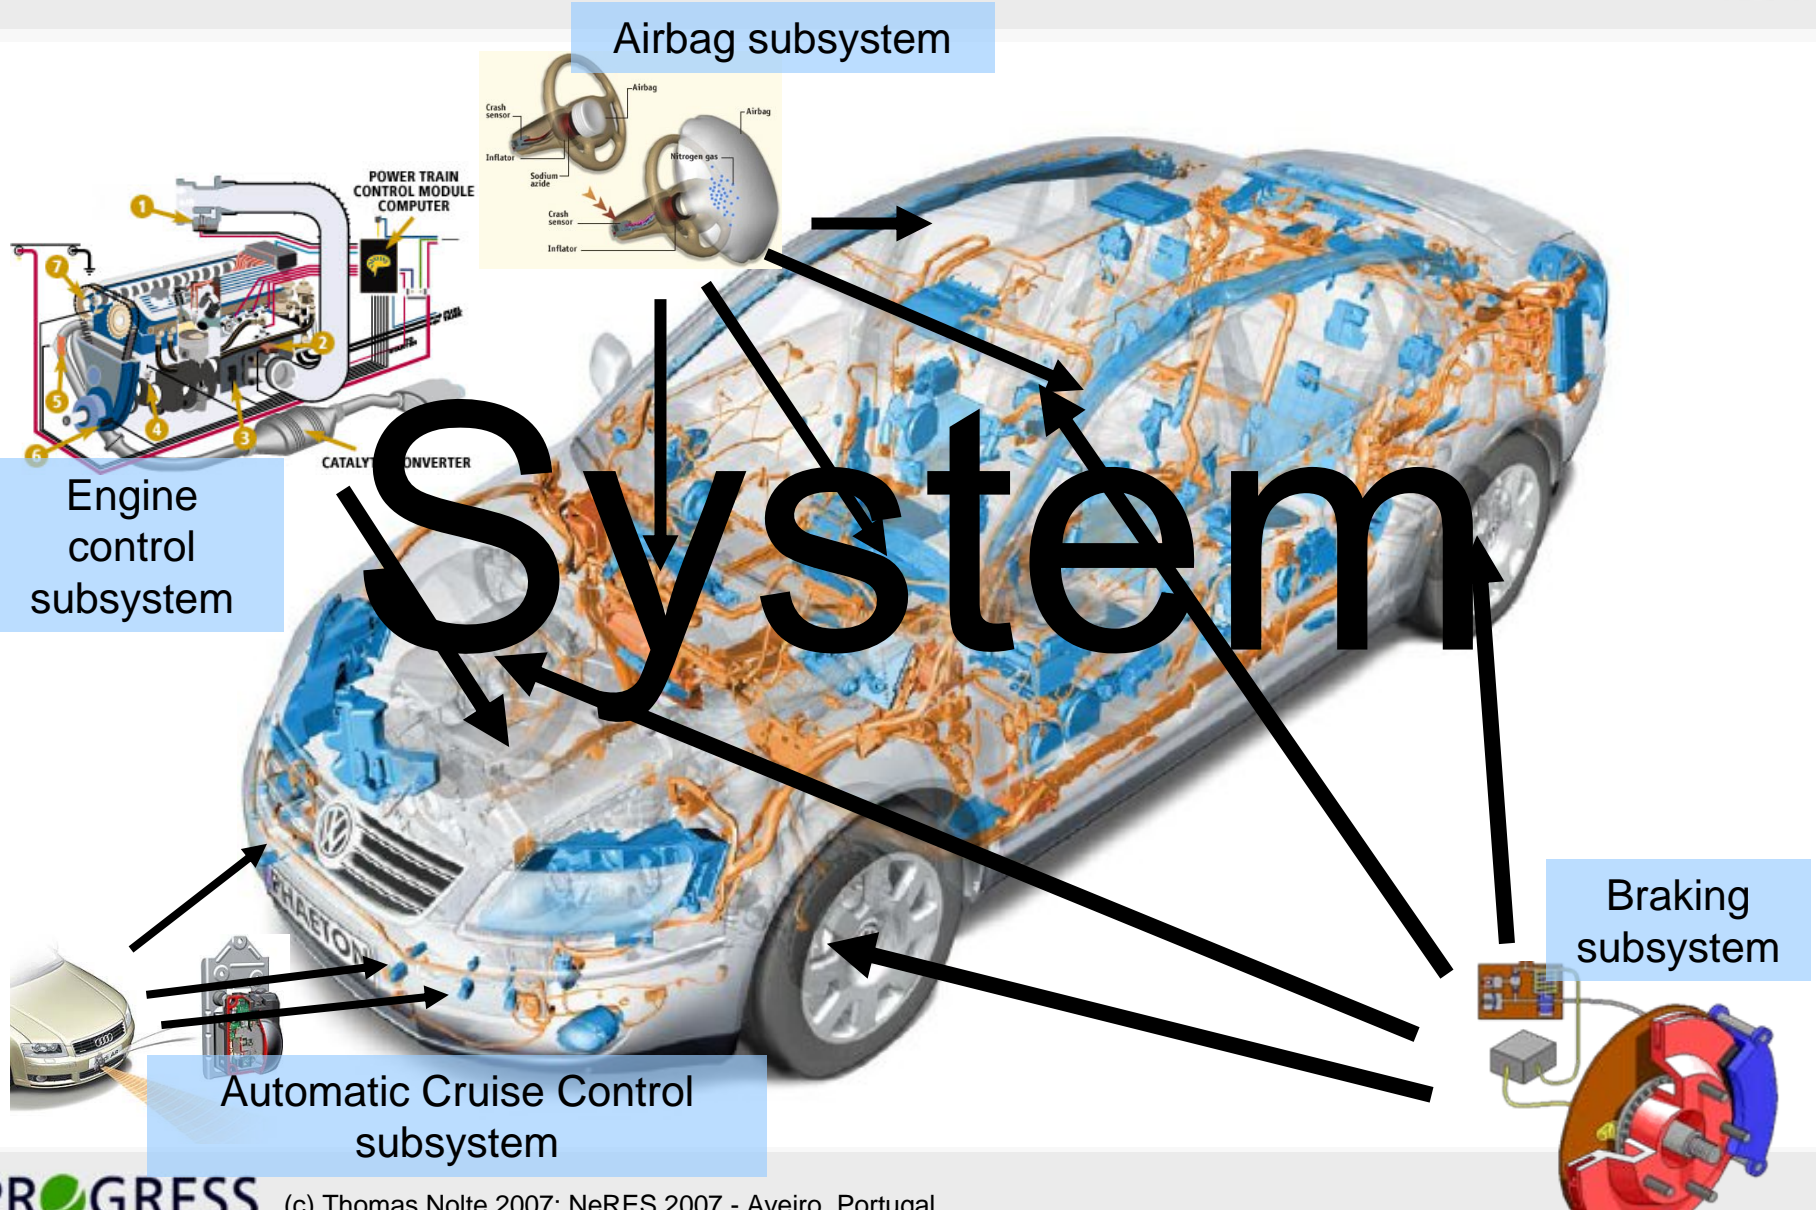

- Subsystem integration
- What we do
- Server-CAN
- Current status

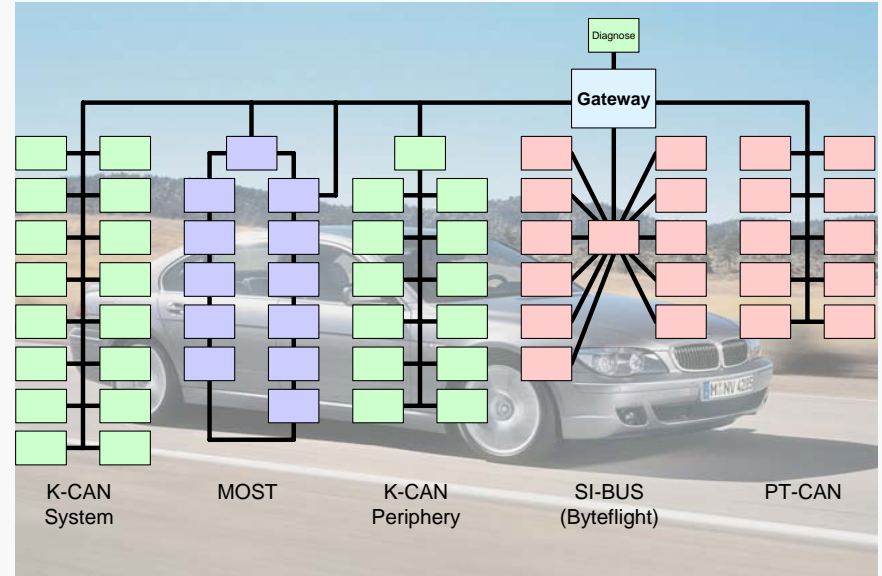

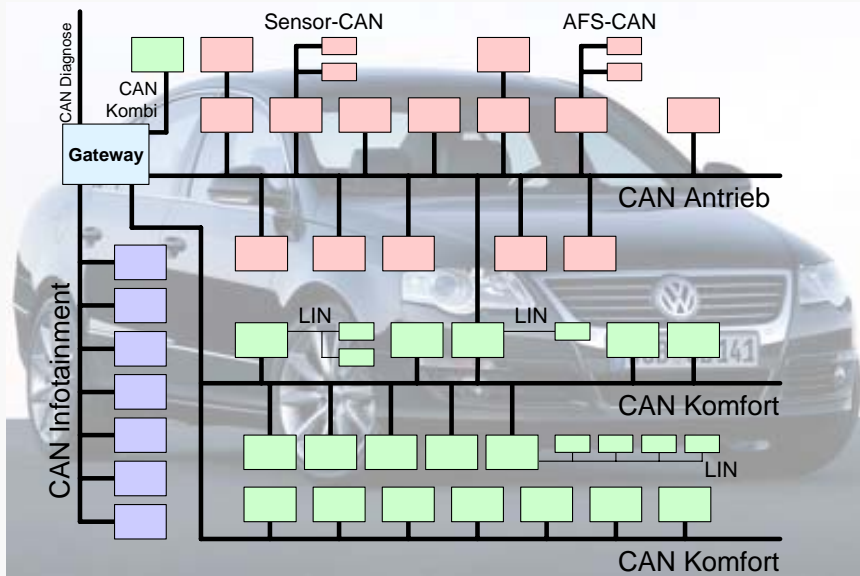

1. Hardware level integration
  - Standardized hardware interfaces
  - Integration takes place at network level, e.g., integrating black box Electronic Control Units (ECUs)
2. Software level integration
  - Black or white box software components
  - Integration is performed by synthesis towards a common (standardized) software platform
3. Model level integration
  - Models are developed and integrated throughout the development

# Terminology: System vs. subsystem

- Example network architectures

- Reduce the number of Electronic Control Units (ECUs)
  - Trend: fewer and more powerful
- Integrate functions (software) on a common architecture
  - Trend: AUTOSAR

- Project within PROGRESS ([www.mrtc.mdh.se/progress](http://www.mrtc.mdh.se/progress))

project leader

Mikael Nolin  
senior researcher

- We focus on achieving predictable execution of a subsystem's software
  - integration of real-time systems
- Our goals are
  - the integration of subsystems should be less complicated
  - it should be possible to develop subsystems independently

## Integrating subsystems generates temporal interference

- Network level challenges
  - Temporal interference between subsystems
    - Tool enabled integration
      - Takes underlying technology and produce (synthesize) an integrated solution
    - Standards enabled integration
      - The use the underlying technology in a specified way guarantees an integrated solution
    - Middleware enabled integration
      - Removal of dependencies inherent in the underlying technology, simplifying an integrated solution
- Node level challenges
  - Temporal interference between subsystems
    - Hierarchical scheduling
  - Logical resource sharing between subsystems
    - Synchronization protocol

Server-CAN

## What is it?

- Server-based scheduler
  - Developed for CAN
- Dynamic priority bandwidth conserving version of PS and TBS
  - Periodic Server-Scheduled CAN (PS<sup>2</sup>-CAN)
  - Simple Server-Scheduled CAN (S<sup>3</sup>-CAN)

## Properties

- Real-time guarantees
- Decouples message ID from priority
- Allows for independent development of subsystems
  - Freedom in ID usage
- Allows for dynamic system reconfiguration
  - Admission control

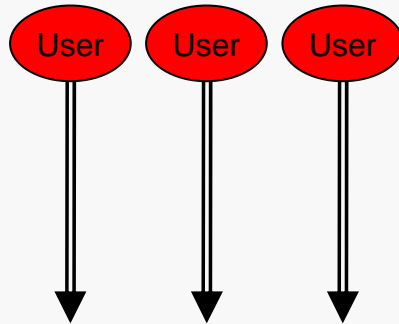

# Integration, what is the problem?

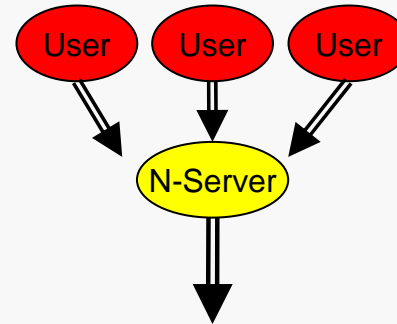

Original system

System using Server-CAN

CAN network

# The Server-CAN concept

**Applications: message transmitters**

**Message transmitters: users**

**Network access servers: N-Servers**

Original system

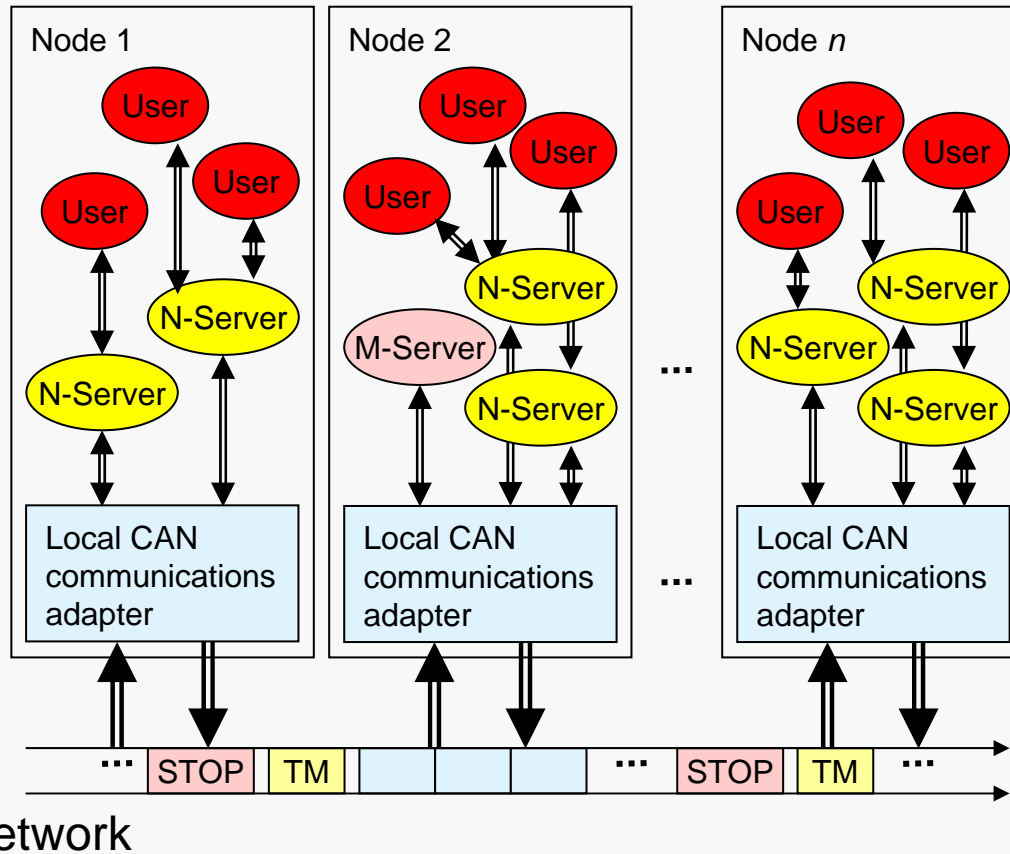

System using Server-CAN

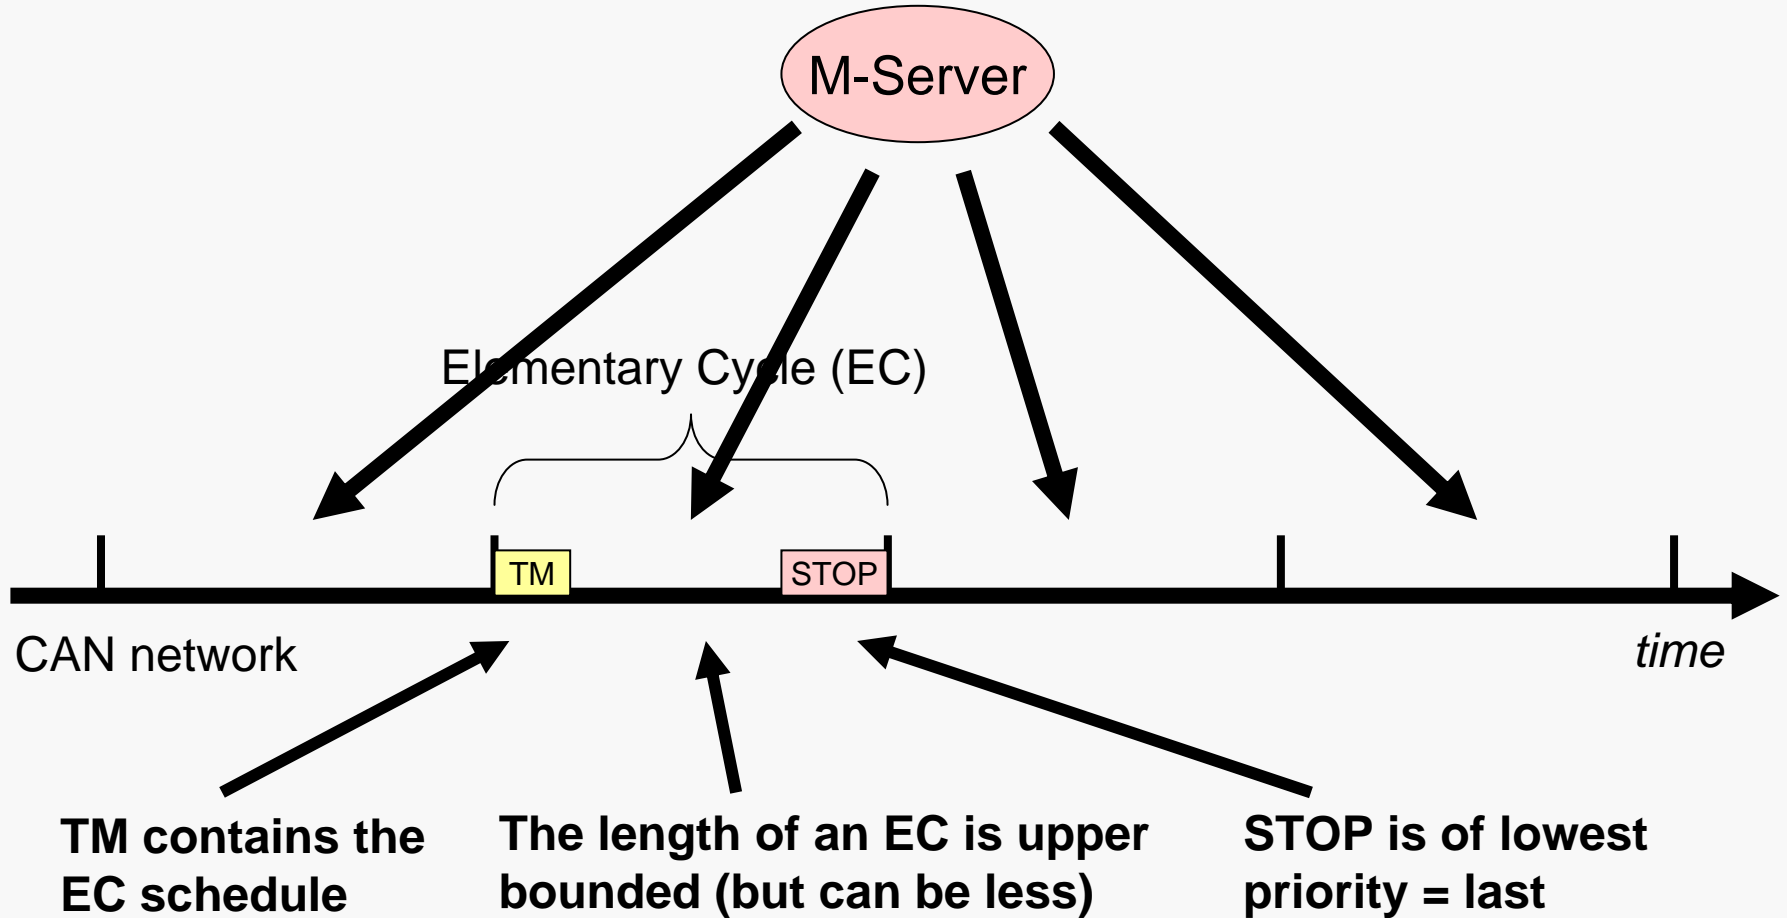

We have control over  
the N-Server...

...thanks to the system  
scheduler: the **M-Server**

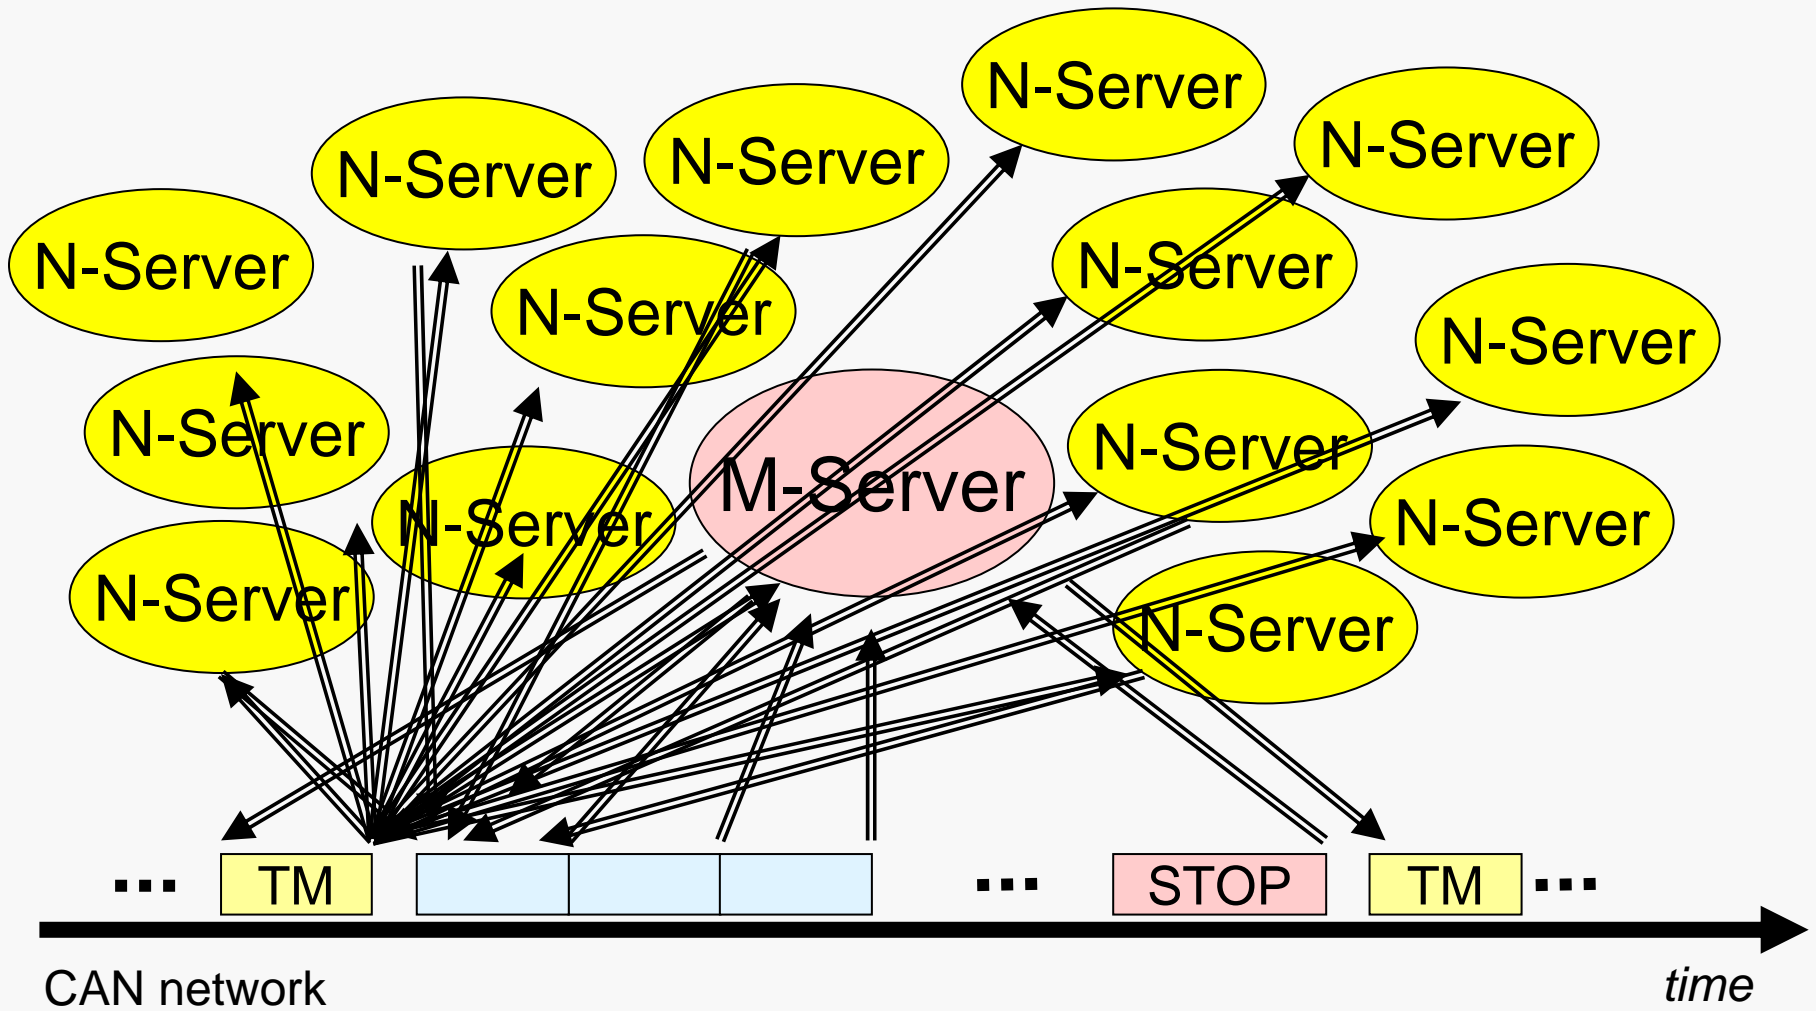

# The Server-CAN architecture

# Scheduling example

- SAVE demonstrator project
  - Server-CAN implementation
  - + many more subprojects
- Platform
  - CrossFire ECU (CC-Systems)
  - CCSimTech simulation technique
- Application
  - Individual case studies
  - Real application from industrial partners

# The SAVE Project

”The goal of SAVE is to establish an engineering discipline for **systematic development** of **component-based software** for **safety-critical embedded vehicular systems**”

6 year program

Supporting industries: ABB ATP/Robotics, Bombardier, CR&T, Saab, Scania, Volvo Car and Volvo TD
