Perspective of the EC

The continued growth of the European economy needs to be **decoupled from energy consumption ...**

Indeed if nothing were to change, final energy consumption in the EU is predicted to **increase up to 25% by 2012...**

ICT have an important role to play in reducing the energy intensity and increasing the energy efficiency of the economy

Facts

ICT's fast growing emissions

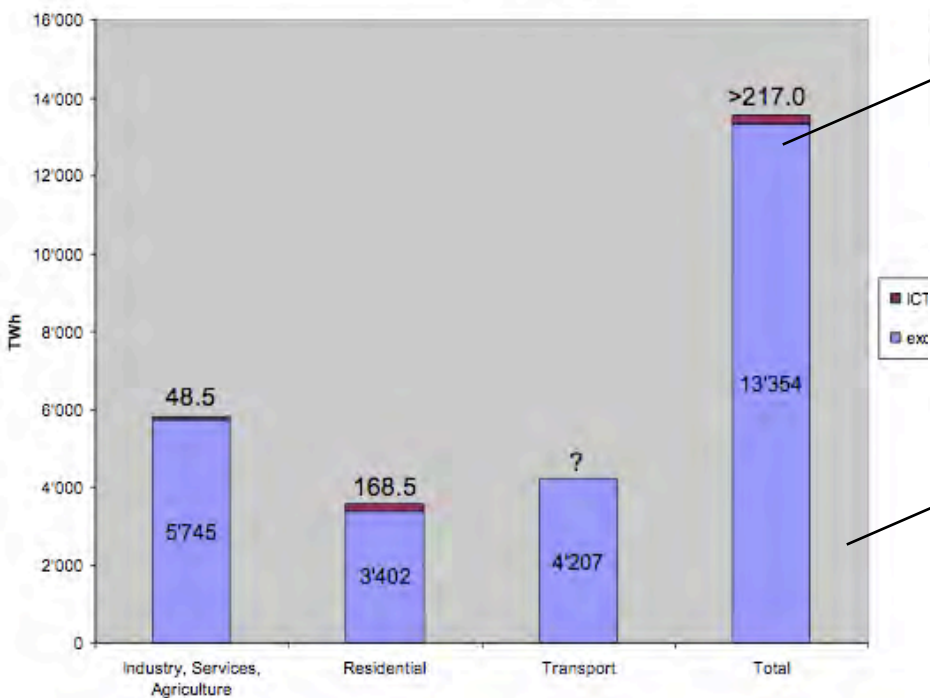

2020

Final Energy Demand EU27 by Sector (2020)

2005

Final Energy Demand EU27 by Sector (2005)

15%

equals to energy of

33447 (!!) light bulbs in one year

What is ICT energy consumption

Energy Consumption refers to the transformation of energy transformed at the point of use

ICT-related energy consumption is the amount of energy consumed by a given ICT system in a given period of time

Challenges in ICT energy consumption

What belongs to ICT?

What is Energy Efficiency?

Energy efficiency of System A is the ratio of the useful output of services from A to the energy consumption by A (e.g. kByte/Ws)

ICT-ensure

TU
Graz

Graz University of Technology

What is ICT-related Energy Efficiency?

Given two systems A and B producing a functionally equivalent output of services $S_a = S_b$

Assume A contains subsystem C which is an ICT system and B does not contain that subsystem ($B = A - C$)

ICT-related Energy Efficiency is the factor by which the energy consumption of a system decreases if an ICT system is added to it and all other things are kept equal.

Challenges in ICT for Energy Efficiency

ICT cannot induce energy efficiency by its own

Expert Study

Which Technologies belong to ICT?

Technology (A: servers, B: network, C: end-user devices; D: embedded)	Energy Consumption	Enabling Effect on Energy Efficiency
A1: servers outside data centres	high	medium
A2: corporate data centres for in-house services	high	high
A3: data centres of ICT service providers	high	high
B1: terrestrial and marine communication: optic fibre cables & copper cables	low	medium
B2: wireless communication: GSM, WiFi, 3G antennas	medium	medium
B3: wireless communication: telecom satellites	low	medium
B4: supporting Internet infrastructure: routers, DNS servers	high	medium
C1: personal computing devices: desktops, laptops, netbooks	high	medium
C2: home telecommunication devices: landline phones	medium	low
C3: mobile telecommunication devices: cellular phones	medium	medium
C4: TV sets, set-top boxes	high	low
C5: portable media (music and/or video) players, e-books	medium	low
C6: digital cameras	medium	low
C7: peripherals (scanners, printers, etc)	medium	low
D: embedded ICT	high	high

ICT-Related Energy Efficiency Potentials

Application area	Highly relevant	Relevant	Somehow relevant	Almost irrelevant	Irrelevant
smart electricity grids	6	2	2		
consumer real-time energy consumption feedback	3	4	2	2	
buildings: intelligent heating/cooling/ventilation	9	2			
buildings and streets: intelligent lighting	5	6			
passenger transport and mobility	7	3	1		
goods transport and logistics	9	1	1		
discrete parts manufacturing	3	4	2	1	
chemical process industries	4	4	2		
virtual meetings and tele-work	4	4	2		
virtual media	2	5	4		

Quality of Data

Data	Very good	Good	Medium	Poor	Very poor
ICT energy consumption – availability			7	3	1
ICT energy consumption – quality			4	6	1

Data	Very good	Good	Medium	Poor	Very poor
ICT for energy efficiency – availability			3	6	2
ICT for energy efficiency – quality		1	1	7	2

Conclusions

Research on ICT Energy Consumption and ICT-induced Energy Efficiency **should be integrated**

Increase of ICT-induced energy efficiency will lead to a **faster increase the ICT energy consumption ...**

Decompose ICT into specific technologies and application areas

Weather supercomputer used to predict climate change is one of Britain's worst polluters

By DAILY MAIL REPORTER

Last updated at 3:28 PM on 27th August 2009

[Comments \(74\)](#) | [Add to My Stories](#)

The Met Office has caused a storm of controversy after it was revealed their £30million supercomputer designed to predict climate change is one of Britain's worst polluters.

The massive machine - the UK's most powerful computer with a whopping 15 million megabytes of memory - was installed in the Met Office's headquarters in Exeter, Devon.

It is capable of 1,000 billion calculations every second to feed data to 400 scientists and uses 1.2 megawatts of energy to run - enough to power more than 1,000 homes.

The computer used 1.2 megawatts to run - enough to power 1,000 homes

Thank You!
